## 0. Introduction - 0.1 Concept

The air / environment (geosphere): Is it a reactor? It's a matter of reactions and transports and mixing ! mixing times:

- vertically lower few kilometers (boundary layer) 1h-1d, mixing with free troposphere 2-10 days
- around the globe on the same latitude (zonal transport) within a few weeks
- from mid latitudes to the pole (meridional transport) within days to weeks, hemispheric mixing 2-6 months
- Between hemispheres about 1 year
- troposphere-stratosphere 1-3 years

Conceptually / knowledge to understand:

- (chemical) reactions
- (meteorological) transports and mixing

Tools to understand:
-3D transport models

- model parameters isolated in laboratory experiments
- significant ,ingredients‘ identified in the ,field‘

### 0.2 Atmospheric pressure and composition

Pressure and temperature profiles in the atmosphere

Pressure declin Ionosphere (Aurora) $\Delta \mathbf{p}=-\mathbf{g} \rho \Delta \mathrm{z}$ $\rho=1.225 \mathrm{mg} / \mathrm{cm}$, $\rightarrow \Delta z / \Delta p=8 \mathbf{m} / \mathbf{h P}$ $16 \mathrm{~m} / \mathrm{hPa}$ in 6 k ,barometric st

### 0.3 Units for quantification of atmospheric trace substances

Ideal gas law: $\mathrm{pV}=\mathrm{nRT}=\mathrm{mRT} / \mathrm{M}_{\mathrm{g}}$
Universal gas constant $\mathrm{R}=8206 \mathrm{~Pa} \mathrm{~L} /(\mathrm{mol} \mathrm{K})=8.314 \mathrm{~J} /(\mathrm{mol} \mathrm{K})=\mathrm{N}_{\mathrm{a}} \mathrm{k}_{\mathrm{B}}$
Avogadro's number $\mathrm{N}_{\mathrm{A}}=6.023 \times 10^{23}$
Boltzmann constant $\mathrm{k}_{\mathrm{B}}=1.38 \times 10^{-23} \mathrm{~J} / \mathrm{K}$
Molar mass $\mathrm{M}_{\mathrm{g} \text { air }} \approx 28.8 \mathrm{~g} / \mathrm{mol}$
Molar volume at $\mathrm{T}_{0}=273 \mathrm{~K}$ and $\mathrm{p}_{0}=101325 \mathrm{~Pa}: \mathrm{V}=22.414 \mathrm{~L} / \mathrm{mol}$
Concentration $\mathrm{c}_{\mathrm{i}}=\mathrm{m}_{\mathrm{i}} / \mathrm{V}\left[\mu \mathrm{g} / \mathrm{m}^{3}\right]$ (for gases: $=$ density)
Mass mixing ratio $\mu_{\mathrm{m}}=\mathrm{c}_{\mathrm{i}} / \mathrm{c}[, \%$, ppmm, ppbm $]$
Partial pressure $\mathrm{p}_{\mathrm{i}}=\mathrm{n}_{\mathrm{i}} \mathrm{RT} / \mathrm{V}_{\mathrm{i}}[\mathrm{Pa}]$
Volume mixing ratio $\mu_{\mathrm{Vi}_{\mathrm{i}}}=\mathrm{p}_{\mathrm{i}} / \mathrm{p}=\mathrm{V}_{\mathrm{i}} / \mathrm{V}[, \%, \mathrm{ppmV}, \mathrm{ppbV}]$
Number density $\mathrm{N}_{\mathrm{i}} / \mathrm{V}=\mathrm{n}_{\mathrm{i}} \mathrm{N}_{\mathrm{A}} / \mathrm{V}=\mathrm{p}_{\mathrm{i}} \mathrm{N}_{\mathrm{A}} / \mathrm{RT}\left[\mathrm{molec} / \mathrm{cm}^{3}\right]$
Avogadro's number $\mathrm{N}_{\mathrm{A}}=6.022 \times 10^{23} \mathrm{molec} / \mathrm{mol}$
More details: Schwartz \& Warneck (1995): Units for use in atmospheric chemistry, Pure Appl. Chem. 67, 1377-1406

Chemical Composition of the Atmosphere

| Constituent | Chemical <br> Formula (sum) | Volume Mixing Ratio $\operatorname{in}_{10^{-13}}{ }^{13} r_{1!}$ Air | Major Sources and Remarks |
| :---: | :---: | :---: | :---: |
| Nitrogen | $\mathrm{N}_{2}$ | 78.084\% | Biological |
| Oxygen | $\mathrm{O}_{2}$ | 20.948\% | Biological |
| Argon | Ar | 0.934\% | Inert |
| Carbon dioxide | $\mathrm{CO}_{2}$ | 360 ppmv | Combustion, ocean, biosphere |
| Neon | Ne | 18.18 ppmv | Inert |
| Helium | He | 5.24 ppmv | Inert |
| Methane | $\mathrm{CH}_{4}$ | 1.7 ppmv | Biogenic and anthropogenic |
| Hydrogen | $\mathrm{H}_{2}$ | 0.55 ppmv | Biogenic, anthropogenic, and photochemical |
| Nitrous oxide | $\mathrm{N}_{2} \mathrm{O}$ | 0.31 ppmv | Biogenic and anthropogenic |
| Carbon monoxide | CO | $50-200 \mathrm{ppbv}$ | Photochemical and anthropogenic |
| Ozone (troposphere) | $\mathrm{O}_{3}$ | 10-500 ppbv | Photochemical |
| Ozone (stratosphere) | $\mathrm{O}_{3}$ | 0.5-10 ppm | Photochemical |
| Nonmethane hydrocarbons |  | 5-20 ppbv | Biogenic and anthropogenic |

| Sulfur dioxide | $\mathrm{SO}_{2}$ | $10 \mathrm{ppt}-1 \mathrm{ppb}$ | Photochemical, volcan |

## 1 Reaction types, kinetics

1.1 Reaction rate coefficient k (dt.: Reaktionsgeschwindigkeitskoeffizient)
temperature dependence:
$-\mathrm{dc}_{\mathrm{i}} / \mathrm{dt}=\mathrm{k}_{\mathrm{T}} \mathrm{c}_{\mathrm{i}}$
$\mathrm{k}_{\mathrm{T}}=\mathrm{A}(\mathrm{T}) \mathrm{e}^{[\Delta \mathrm{E} /(\mathrm{RT})]}$
Universal gas constant $\mathrm{R}=\mathrm{k}_{\mathrm{B}} \mathrm{N}_{\mathrm{A}}=1.38 \times 10^{-23} \mathrm{~J} / \mathrm{K} \times 6.023 \times 10^{23} / \mathrm{mol}$
Providing the energy is sufficiently large, the temperature dependence of A
is unimportant, and $\mathrm{k}_{\mathrm{T}}$ follows the Arrhenius expression:
$\mathrm{k}_{\mathrm{T}}=\mathrm{A} \mathrm{e}^{\left[\mathrm{E}_{\mathrm{a}} /(\mathrm{RT})\right]}$
with activation energy $\mathrm{E}_{\mathrm{a}}$
Frequently used, too: van t'Hoff expression:
$\mathrm{k}_{\mathrm{T}}=\mathrm{B} \mathrm{e}^{\left[-\mathrm{E}_{\mathrm{a}} / \mathrm{R}\left(1 / \mathrm{T}-1 / \mathrm{T}_{\mathrm{ref}}\right)\right]}$,
The two expressions are equal via: $\mathrm{A}=\mathrm{Be}^{\left[\mathrm{E}_{\mathrm{a}} /\left(\mathrm{RT}_{\text {ref }}\right)\right]}$

Rate coefficient from gas kinetic theory
$=$ effective reactions per unit of time $=$
$=$ collision frequency $x$ likelyhood of reaction per collision

1) Molecules need to collide ( $\approx 10^{9} / \mathrm{s}$ at $10^{5} \mathrm{~Pa}$ ).

They are close enough to collide during $\approx\left(10^{-13}-10^{-12}\right) \times 10^{9} / \mathrm{s}$
Collision frequency $\quad Z_{i j}=\left(\frac{8 k T}{\pi m_{i j}}\right)^{1 / 2} \sigma_{i j}^{2} N_{i} N_{j} \quad \mathrm{~cm}^{-3} \mathrm{~s}^{-1}$

$$
\begin{gathered}
\left(\frac{8 k T}{\pi m_{i j}}\right)^{1 / 2} \text { root-mean-square rel } \\
m_{i j}=\frac{m_{i} m_{j}}{m_{i}+m_{j}} \quad \text { reduced mass }
\end{gathered}
$$

$N_{i}:$ number density $\left(\mathrm{cm}^{-3}\right)$
$k=1.381 \cdot 10^{-23} \mathrm{JK}^{-1} \quad$ Boltzmann constant
$\sigma_{\mathrm{ij}}^{2}:$ collision cross section

## Speed, collisions in absolute terms:

from Maxwell-Boltzmann distribution function of molecular velocities (gas kinetic theory):
$\mathrm{dN} / \mathrm{N}=\mathrm{c}^{\left(\mathrm{m}\left\langle\mathrm{v}_{\mathrm{i}}\right\rangle^{2} / 2 \mathrm{kT}\right)} ;$ with $\mathrm{c}=(\mathrm{m} / 2 \pi \mathrm{kT})^{0.5}$
$\left.<\mathrm{v}_{\mathrm{i}}\right\rangle=$ mean absolute velocity of molecules
corresponding mean free path $\lambda$ with regard to collisions

$$
\begin{aligned}
& \lambda_{\mathrm{i}}=1 /\left[\left(\mathrm{N}_{\mathrm{A}} / \mathrm{V}\right)\left(\sqrt{ } 2 \pi \sigma_{\mathrm{i}}^{2}\right)\right], \\
& \mathrm{N}_{\mathrm{A}} / \mathrm{V}=6.022 \times 10^{23} / 0.0224=2.46 \times 10^{25} \mathrm{molec} / \mathrm{m}^{3}
\end{aligned}
$$

$\left.\mathrm{N}_{2}:<\mathrm{v}\right\rangle=0.51 \mathrm{~m} / \mathrm{s}=1840 \mathrm{~km} / \mathrm{h}, \lambda=65 \mathrm{~nm}$
$\left.\mathrm{CO}_{2}:<\mathrm{v}\right\rangle=0.41 \mathrm{~m} / \mathrm{s}=1490 \mathrm{~km} / \mathrm{h}, \lambda=44 \mathrm{~nm}$

## 2) Extra energy is needed to overcome the transition state

As molecules approach each other they have to overcome an energy barrier because of electronic repulsion. The energy they absorb leads to a loosening of the intramolecular bonds until a transition state is reached, which can then either fall back into the original molecules or proceed to yield the products of the reaction. Reaction enthalpy $\Delta \mathrm{H}_{\mathrm{r}}$.

## Likelyhood: collision cross section, $\sigma_{i j}$

In the transition state, usually the energy provided from bond formation is less than the energy consumption from bond breaking.
The collision cross section takes into account that a minimum amount of energy is needed. It is not necessarily provided with every orientation of the molecules during approach (steric factor).

$$
\sigma_{i j}=\pi\left(r_{i}+r_{j}\right)^{2}\left(1-\frac{E_{0}}{E}\right) \quad \text { for } E \geq E_{0}, 0 \text { elsewhere }
$$

Integrated over all total energies from 0 to $\infty$, the frequency of reactive collisions becomes

$$
Z_{i j}^{R}=\underbrace{\pi\left(r_{i}+r_{j}\right)^{2}\left(\frac{8 k T}{\pi m_{i j}}\right)^{1 / 2}}_{k} \quad \begin{aligned}
& \begin{array}{l}
\text { Theoretical maximum } \\
\begin{array}{l}
\text { at } 1000 \mathrm{hPa}, 293 \mathrm{~K} \\
\text { (for } \mathrm{r}_{\mathrm{i}}, \mathrm{r}_{\mathrm{j}}=0.2 \mathrm{~nm}, \mathrm{E}_{0}=0 \text { and no steric } \\
\text { hindrance }): \mathrm{k} \approx 2 \mathrm{k} 10^{-10} \mathrm{~cm}^{3} / \mathrm{molec} / \mathrm{s} \\
\mathrm{~s}
\end{array}
\end{array}
\end{aligned}
$$

### 1.2 Homogeneous gas-phase reactions

## Reactions can be unimolecular, bi- or termolecular.

The rate law of a reaction of the general form

$$
\mathrm{aA}+\mathrm{bB} \rightarrow \mathrm{cC}+\mathrm{dD}
$$

Is defined as

Rate $(\mathrm{dt}:$ : Rate $)=-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt} / \mathrm{a}=-\mathrm{dc}_{\mathrm{B}} / \mathrm{dt} / \mathrm{b}=\mathrm{dc}_{\mathrm{C}} / \mathrm{dt} / \mathrm{c}=\mathrm{dc}_{\mathrm{D}} / \mathrm{dt} / \mathrm{d}$ example:

$$
2 \mathrm{NO}+\mathrm{O}_{2} \rightarrow 2 \mathrm{NO}_{2}
$$

Rate $=-\mathrm{dc}_{\mathrm{NO}} / \mathrm{dt} / 2=-\mathrm{dc}_{\mathrm{O} 2} / \mathrm{dt}=\mathrm{dc}_{\mathrm{NO} 2} / \mathrm{dt} / 2$

Second order
Usually: bimolecular

$$
\begin{aligned}
& \mathrm{A}+\mathrm{B} \rightarrow \mathrm{C}+\mathrm{D} \\
& \mathrm{~A}+\mathrm{B} \rightarrow \mathrm{C}
\end{aligned}
$$

; A, B, C, D molecules or radicals
example:
$\mathrm{O}+\mathrm{O}_{2} \rightarrow \mathrm{O}_{3}$
$\mathrm{NO}+\mathrm{O}_{3} \rightarrow \mathrm{NO}_{2}+\mathrm{O}_{2}$
$\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{B}} / \mathrm{dt}=\mathrm{k}^{(2)} \mathrm{c}_{\mathrm{A}}{ }^{1} \mathrm{c}_{\mathrm{B}}{ }^{1}$
Reaction rate: second order ( $1+1=2$ )
Reaction rate coefficient (denoting the order): $\mathrm{k}^{(2)}$
The reaction order is given by the sum of the exponentials, $\mathrm{n}+\mathrm{m}+\ldots$, of the concentration terms in the rate law of the form $-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=\mathrm{kc}_{\mathrm{A}}{ }^{\mathrm{n}} \mathrm{c}_{\mathrm{B}}{ }^{\mathrm{m}}(\mathrm{n}=$ zero or integer or fraction*)
It is determined empirically.

Here, M stands for any molecule or atom (i.e. $\mathrm{N}_{2}, \mathrm{O}_{2}, \ldots$ ), not transformed but required to absorb excess energy, e.g. of an activated intermediate state:

$$
\begin{aligned}
& \mathrm{A}+\mathrm{B}=\mathrm{AB} *+\mathrm{C}+\mathrm{D} \\
& \mathrm{~A}+\mathrm{C}+\mathrm{D}
\end{aligned}
$$

Example: thermic dissociation $\mathrm{HOONO}_{2} \rightarrow \mathrm{HO}_{2}+\mathrm{NO}_{2}$ Reaction rate $\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=\mathrm{k}^{(1)} \mathrm{c}_{\mathrm{A}}{ }^{1}$ $\mathrm{k}^{(1)}=\mathrm{k}^{(2)} \mathrm{c}_{\mathrm{M}}{ }^{1}\left(\mathrm{c}_{\mathrm{M}}{ }^{1}\right.$ constant $)$
$\mathrm{Cl}+\mathrm{HO}_{2} \rightarrow \mathrm{HCl}+\mathrm{O}_{2}$
$\mathrm{Cl}+\mathrm{HO}_{2} \rightarrow \mathrm{ClO}+\mathrm{OH}$
$\mathrm{Cl}+\mathrm{CH}_{2}\left(+\mathrm{O}_{2}\right) \rightarrow \mathrm{HCl}+\mathrm{CO} \mathrm{HO} 2$
$\mathrm{ClO}+\mathrm{HO}_{2} \rightarrow \mathrm{HOCl}+\mathrm{O}_{2}$
$\mathrm{HOCl}+\mathrm{OH} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{ClO}$

## Reaction orders

$\mathrm{A}+\mathrm{B} \rightarrow \mathrm{C}+\mathrm{D}$
is $2^{\text {nd }}$ order or - in case $\mathrm{dc}_{\mathrm{B}} / \mathrm{dt} \approx 0-$ pseudo- $1^{\text {st }}$ order
$\mathrm{A}+\mathrm{B}+\mathrm{M} \rightarrow \mathrm{C}+\mathrm{D}+\mathrm{M}$
is $2^{\text {nd }}$ order or - in case $\mathrm{dc}_{\mathrm{B}} / \mathrm{dt} \approx 0-$ pseudo- 1 st order or

- if $\mathrm{p} \ll 1000 \mathrm{hPa}$ - between $2^{\text {nd }}$ and $3^{\text {rd }}$ order

The unit of a homogeneous gas-phase rate is $\left[\mathrm{molec} / \mathrm{cm}^{3} / \mathrm{s}\right]$.

A $1^{\text {st }}$ or pseudo- $1^{\text {st }}$ order rate law reads:

$$
-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=\mathrm{k}^{(1)} \mathrm{c}_{\mathrm{C}} \text {, with } \mathrm{k}^{(1)}[1 / \mathrm{s}]
$$

A $2^{\text {nd }}$ order rate law reads:
$-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=\mathrm{k}^{(2)} \mathrm{c}_{\mathrm{C}} \mathrm{c}_{\mathrm{D}}$, with $\mathrm{k}^{(2)}\left[\mathrm{cm}^{3} / \mathrm{molec} / \mathrm{s}\right]$.
A $3^{\text {rd }}$ order rate law reads e.g.:
$-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=\mathrm{k}^{(3)} \mathrm{c}_{\mathrm{C}}{ }^{2} \mathrm{c}_{\mathrm{D}}$, with $\mathrm{k}^{(3)}\left[\mathrm{cm}^{6} / \mathrm{molec}^{2} / \mathrm{s}\right]$.
3. between $2^{\text {nd }}$ and $3^{\text {rd }}$ order: In the range of pressures and temperatures in the upper troposphere and stratosphere ( $\mathrm{c}_{\mathrm{M}}$ small) many reactions are in the region between $2^{\text {nd }}$ and $3^{\text {rd }}$ order reactions:

$$
k=\frac{k_{0} \mathrm{M}}{1+k_{0} \mathrm{M} / k_{\infty}} F_{C}^{\left(1+\log \left(k_{0} M / k_{\infty}\right)^{2}\right)^{-1}} \quad \mathrm{~F}_{\mathrm{C}} \approx 0.6
$$

$$
k_{0}(T)=k_{0}^{300 K}\left(\frac{T}{300 K}\right)^{-n}, \quad k \infty(T)=k_{\infty}^{300 K}\left(\frac{T}{300 K}\right)^{-m}
$$

$\mathrm{k}_{0}, \mathrm{k}_{\infty}=$ low, high pressure limiting rate constant
(Iroe, 1979)
$\mathrm{F}_{\mathrm{C}}=$ broadening factor of falloff curve between $2^{\text {nd }}$ and $3^{\text {rd }}$ order in the range of atmospheric pressures

$$
\mathrm{NO}_{2}+\mathrm{HO}_{2}+\mathrm{M} \rightarrow \mathrm{HO}_{2} \mathrm{NO}_{2}+\mathrm{M}
$$

$$
\mathrm{K}_{0}=\mathrm{k}_{0}(\mathrm{~T}) \mathrm{c}_{\mathrm{M}}, \mathrm{n}=3.2
$$

$$
\mathrm{K}_{\infty}=\mathrm{k}_{\infty}(\mathrm{T}), \mathrm{m}=1.4
$$

$$
\mathrm{k}_{288 \mathrm{~K} / 000 \mathrm{hPa}}=1.9 \times 10^{-12} \mathrm{~cm}^{3} / \mathrm{molec} / \mathrm{s}
$$

$$
\mathrm{k}_{288 \mathrm{~K} / 500 \mathrm{hPa}}=1.5 \times 10^{-12} \mathrm{~cm}^{3} / \mathrm{molec} / \mathrm{s}
$$

$$
\mathrm{k}_{230 \mathrm{~K} / 500 \mathrm{hPa}}=2.3 \times 10^{-12} \mathrm{~cm}^{3} / \mathrm{molec} / \mathrm{s}
$$

$$
\mathrm{k}_{230 \mathrm{~K} / 1000 \mathrm{hPa}}=3.0 \times 10^{-12} \mathrm{~cm}^{3} / \mathrm{molec} / \mathrm{s}
$$

$$
\begin{aligned}
& \mathrm{NO}+\mathrm{HO}_{2} \rightarrow \mathrm{NO}_{2}+\mathrm{OH} \\
& \mathrm{NO}+\mathrm{CH}_{3} \mathrm{O}_{2} \rightarrow \mathrm{NO}_{2}+\mathrm{CH}_{3} \mathrm{O} \\
& \mathrm{NO}+\mathrm{NO}_{3} \rightarrow 2 \mathrm{NO}_{2} \\
& \mathrm{NO}_{2}+\mathrm{O}\left({ }^{3} \mathrm{P} \mathrm{~h}_{\mathrm{M}} \rightarrow \mathrm{NO}+\mathrm{O}_{2}\right. \\
& \mathrm{NO}_{2}+\mathrm{ClO} \xrightarrow{\text { }} \mathrm{ClONO}_{2} \\
& \mathrm{NO}_{2}+\mathrm{HO}_{2} \xrightarrow[\mathrm{M}]{\mathrm{M}} \mathrm{HO}_{2} \mathrm{NO}_{2} \\
& \begin{array}{l}
\mathrm{NO}_{2}+\mathrm{OH}_{3} \xrightarrow{M} \mathrm{HNO}_{2} \\
\mathrm{NO}_{2}+\mathrm{NO}_{2} \mathrm{O}_{5}
\end{array} \\
& \mathrm{HNO}_{2}+\mathrm{OH} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{NO}_{2}
\end{aligned}
$$

### 1.3 Combinations of thermic reactionsQuasi steady state approximation

Second order
Usually: bimolecular

$$
\begin{aligned}
& \mathrm{A}+\mathrm{B} \rightarrow \mathrm{C}+\mathrm{D} \\
& \mathrm{~A}+\mathrm{B} \rightarrow \mathrm{C}
\end{aligned}
$$

A, B, C, D molecules or radicals
example:

$$
\begin{aligned}
& \mathrm{O}+\mathrm{O}_{2} \rightarrow \mathrm{O}_{3} \\
& \mathrm{NO}+\mathrm{O}_{3} \rightarrow \mathrm{NO}_{2}+\mathrm{O}_{2}
\end{aligned}
$$

Reaction rate: second order $(1+1=2)$
$\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{B}} / \mathrm{dt}=\mathrm{kc}_{\mathrm{A}}{ }^{1} \mathrm{c}_{\mathrm{B}}{ }^{1}$
Reaction rate coefficient: $\mathrm{k}^{(2)}$
$\mathrm{k}=\mathrm{A} \exp \left[-\left(\mathrm{E}_{\mathrm{a}} / \mathrm{R}\right) \mathrm{T}\right]$
Arrhenius expression, preexponential factor A, activation energy $\mathrm{E}_{\mathrm{a}}$ $\mathrm{k}\left(\mathrm{T}^{-1}\right) \rightarrow$ slope $-\mathrm{E}_{\mathrm{a}} / \mathrm{R}$, intercept $\ln \mathrm{A}, \mathrm{E}_{\mathrm{a}} / \mathrm{R}>0 \leftrightarrow$ faster at higher T

### 1.3 Combinations of thermic reactionsQuasi steady state approximation

Second order
Usually: bimolecular

$$
\begin{aligned}
& \mathrm{A}+\mathrm{B} \rightarrow \mathrm{C}+\mathrm{D} \\
& \mathrm{~A}+\mathrm{B} \rightarrow \mathrm{C}
\end{aligned}
$$

A, B, C, D molecules or radica example:

$$
\begin{aligned}
& \mathrm{O}+\mathrm{O}_{2} \rightarrow \mathrm{O}_{3} \\
& \mathrm{NO}+\mathrm{O}_{3} \rightarrow \mathrm{NO}_{2}+\mathrm{O}_{2}
\end{aligned}
$$

Reaction rate: second order (1+ $\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{B}} / \mathrm{dt}=\mathrm{kc}$

Very frequent:
(1) $\mathrm{A}+\mathrm{B} \rightarrow \mathrm{C}^{*}$
(-1) $\quad \mathrm{C}^{*} \rightarrow \mathrm{~A}+\mathrm{B}$
(2) $\mathrm{C}^{*}+\mathrm{M} \rightarrow \mathrm{C}$

Intermediate $\mathrm{C}^{*}$ :
$\mathrm{dc}_{\mathrm{C}^{*}} / \mathrm{dt}=\mathrm{k}_{1} \mathrm{c}_{\mathrm{A}} \mathrm{c}_{\mathrm{B}}-\mathrm{k}_{-1} \mathrm{c}_{\mathrm{C}^{*}}-\mathrm{k}_{2} \mathrm{c}_{\mathrm{C}^{*}} \mathrm{c}_{\mathrm{M}}$
Lifetime of $\mathrm{C}^{*}$ short $\rightarrow \mathrm{dc}_{\mathrm{C}^{*}} / \mathrm{dt}=0$ Hence:
$\mathrm{k}_{1} \mathrm{c}_{\mathrm{A}} \mathrm{c}_{\mathrm{B}}=\mathrm{k}_{-1} \mathrm{c}_{\mathrm{C}^{*}}+\mathrm{k}_{2} \mathrm{c}_{\mathrm{C}^{*}} \mathrm{c}_{\mathrm{M}}$
$\mathrm{k}_{1} \mathrm{c}_{\mathrm{A}} \mathrm{c}_{\mathrm{B}}=\mathrm{c}_{\mathrm{C}^{*}}\left(\mathrm{k}_{-1}+\mathrm{k}_{2} \mathrm{c}_{\mathrm{M}}\right)$
$\mathrm{c}_{\mathrm{C}^{*}}=\mathrm{k}_{1} \mathrm{c}_{\mathrm{A}} \mathrm{c}_{\mathrm{B}} /\left(\mathrm{k}_{-1}+\mathrm{k}_{2} \mathrm{c}_{\mathrm{M}}\right)$
Reaction rate coefficient: $\mathrm{k}^{(2)}$
$\mathrm{k}=\mathrm{A} \exp \left[-\left(\mathrm{E}_{\mathrm{a}} / \mathrm{R}\right) \mathrm{T}\right]$
Arrhenius expression, preexpose $\mathrm{k}\left(\mathrm{T}^{-1}\right) \rightarrow$ slope $-\mathrm{E}_{\mathrm{a}} / \mathrm{R}$, intercept $\ln \mathrm{A}$,

## Example

$\begin{array}{ll}\text { (1) } & O+O_{2}=O_{3}{ }^{*} \\ \text { (2) } & O_{3} *+M \rightarrow O_{3}\end{array}$
(1) $O+O_{2}=O_{3}^{*}$
(2) $O_{3}{ }^{*}+M \rightarrow O_{3}$
$\mathrm{c}_{\mathrm{O} 3^{*}}=\mathrm{k}_{1} \mathrm{c}_{\mathrm{O}} \mathrm{c}_{\mathrm{O} 2} /\left(\mathrm{k}_{-1}+\mathrm{k}_{2} \mathrm{c}_{\mathrm{M}}\right)$
$\mathrm{dc}_{\mathrm{O} 3} / \mathrm{dt}=\mathrm{k}_{2} \mathrm{c}_{\mathrm{O} 3} \mathrm{c}_{\mathrm{M}}$
$\left.\mathrm{dc}_{\mathrm{O} 3} / \mathrm{dt}=\mathrm{k}_{1} \mathrm{k}_{2} \mathrm{c}_{\mathrm{O}} \mathrm{c}_{\mathrm{O} 2} \mathrm{c}_{\mathrm{M}} /\left(\mathrm{k}_{-1}+\mathrm{k}_{2} \mathrm{c}_{\mathrm{M}}\right)=\mathrm{k}_{1} \mathrm{k}_{2} \mathrm{c}_{\mathrm{M}} /\left(\mathrm{k}_{-1}+\mathrm{k}_{2} \mathrm{c}_{\mathrm{M}}\right)\right] \mathrm{c}_{\mathrm{O}} \mathrm{c}_{\mathrm{O} 2}$.
High pressure limit: $\quad \mathrm{k}_{-1} \approx 0 \rightarrow \mathrm{k}_{\infty}=\mathrm{k}_{1}$

Low pressure limit: $\quad \mathrm{c}_{\mathrm{M}} \rightarrow 0 \quad \rightarrow \mathrm{k}_{0}=\mathrm{k}_{1} \mathrm{k}_{2} / \mathrm{k}_{-1}$

## Reaction rate compilations

Compilations are considered the state-of-the-art description of atmospheric chemistry, because

- complete knowledge is summarized and assessed, and
- laboratory kineticists from around the world are involved

## However,

- there is no guarantee for completeness, and
- some rate constants are very uncertain, but uncertainty is quantified
- Chemical kinetics and photochemical data for use in stratospheric modeling Eval. No. 12 (JPL-Publ-97-4; NAS 1.26112606; NASA CR-97-112606 ), 1997 (updated 2005, http://ntrs.nasa.gov/search.jsp

### 1.4 Photochemical reactions

## Radiation absorption in the atmosphere

Gaseous molecules absorb ultraviolet, visible and infrared light: $\mathrm{O}_{3}$

Consequences:

- photophysical and photochemical molecular processes
- change of spectrum:

## Specific because of vibrational-rotational and electronic transitions:

A series of vibrational-rotational states are populated (temperature dependent, Boltzmann) within electronic states. Vibrational-rotational (P, Q, R branches of change of J) and electronic transitions follow quantum rules (selection rules, , allowed‘ or not allowed). These correspond to characteristic spectroscopic patterns. Therefore, emissior and absorption spectroscopy allows for unambiguous identification of molecules.

## Electronic excitation:

## $\mathrm{A} \rightarrow \mathrm{B}+\mathrm{C}$

The energy barrier will be smaller and the distance between atoms will be larger for the excited molecule.

## Fates of electronically excited molecules:

Photophysical primary processes: emission (fluorescence, phosphorescence), nonradiative energy transition into heat

Photochemical primary processes: dissociation, isomerization, re-arrangement, reaction

Example for photophysical process: $\mathrm{A}^{*}+\mathrm{B} \rightarrow \mathrm{A}+\mathrm{B}^{*}$ :
$\mathrm{SO}_{2}\left({ }^{3} \mathrm{~B}_{1}\right)+\mathrm{O}_{2}\left({ }^{3} \Sigma_{\mathrm{g}}\right) \rightarrow \mathrm{SO}_{2}\left({ }^{1} \mathrm{~A}_{1}\right)+\mathrm{O}_{2}\left({ }^{1} \Sigma_{\mathrm{g}}\right)$
Example for photochemical process:
$\mathrm{NO}_{2}\left(\mathrm{X}^{2} \mathrm{~A}\right)+\mathrm{h} \nu(290<\lambda<430 \mathrm{~nm}) \rightarrow \mathrm{NO}\left(\mathrm{X}^{2} \Pi\right)+\mathrm{O}\left({ }^{3} \mathrm{P}\right)$
Def.:
Efficiency of a primary photochemical process i is given by ist quantum yield $\phi_{i}:=$ number of excited molecules by process i divided by total number of photons absorbed.
The sum of the $\phi_{i}$ of all the photochemical primary processes $=1$.

## Photodissociations

Unimolecular

$$
\mathrm{A}+\mathrm{h} v \rightarrow \mathrm{~B}+\mathrm{C}
$$

$\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}$ molecules or radicals example:

$$
\mathrm{O}_{3}+\mathrm{h} v \rightarrow \mathrm{O}_{2}+\mathrm{O}\left({ }^{3} \mathrm{P}\right)
$$

Reaction rate coefficient j (photolysis rate):

$$
\mathrm{dc}_{\mathrm{C}} / \mathrm{dt}=-\mathrm{dc}_{\mathrm{A}} / \mathrm{dt}=\mathrm{jc}_{\mathrm{A}}
$$

Ground state, A
/excitation state, A*:
$\mathrm{A}+\mathrm{h} \nu \rightarrow \mathrm{A}^{*}$
Example:
$O+h \nu \rightarrow O^{*}$
i.e. $O\left({ }^{3} P\right)+h v \rightarrow O\left({ }^{( } D\right)$

Energy ranges, correspondence between energy and wavelength

$$
\begin{aligned}
& \lambda=\mathrm{c} / v \\
& \Delta \mathrm{E}=\mathrm{hc} / \lambda=\mathrm{hc} \omega
\end{aligned}
$$

with frequency $v$
Planck relationship (wavelength $\lambda$, wavenumber $\omega$, Planck's constant h $=6.626 \times 10^{-34} \mathrm{Js}$ )

Commonly used energy units:

$$
\begin{aligned}
& \left(\mathrm{kJ} \mathrm{~mol}^{-1}\right) \\
& \quad \times 0.2390=\mathrm{kcal} \mathrm{~mol}^{-1} \\
& \times 0.0104=\mathrm{eV} \\
& \times 83.59=\mathrm{cm}^{-1} \\
& \left(\mathrm{kcal} \mathrm{~mol}^{-1}\right) \\
& \quad \times 4.184=\mathrm{kJ} \mathrm{~mol}^{-1} \\
& \times 0.04336=\mathrm{eV} \\
& \times 349.8=\mathrm{cm}^{-1} \\
& \left(\mathrm{~cm}^{-1}\right) \\
& \times 1.196 \times 10^{-2}=\mathrm{kJ} \mathrm{~mol}^{-1} \\
& \times 2.859 \times 10^{-3}=\mathrm{kcal} \mathrm{~mol}^{-1} \\
& \times 1.240 \times 10^{-4}=\mathrm{eV} \\
& (\mathrm{eV}) \\
& \times 96.49=\mathrm{kJ} \mathrm{~mol}^{-1} \\
& \times 23.06=\mathrm{kcal} \mathrm{~mol}^{-1} \\
& \times 8.064 \times 10^{3}=\mathrm{cm}^{-1}
\end{aligned}
$$

## Energy ranges, correspondence between energy and wavelength

$\lambda=c / v$
$\Delta \mathrm{E}=\mathrm{hc} / \lambda=\mathrm{hc} \omega$

# Planck relationship (wavelength $\lambda$, wavenumber $\omega$, Planck's constant h $=6.626 \times 10^{-34} \mathrm{Js}$ )

[^0]
## The rate of photochemical reactions Absorption

$\ln \left(\mathrm{I}_{0} / \mathrm{I}\right)=\sigma \mathrm{Nd} \quad$ Beer-Lambert law
$\mathrm{I} / \mathrm{I}_{0}=\mathrm{e}^{(-\sigma \mathrm{Nd})}$
absorption cross section $\sigma\left(\mathrm{cm}^{2}\right.$, default: base e) molecule concentration $\mathrm{N}\left(\mathrm{cm}^{-3}\right)$, depth of absorptive layer $\mathrm{d}(\mathrm{cm})$ optical depth $\mathrm{OD}=\sigma \mathrm{Nd}$

Caution: Most measurements are made to the base $10\left(\log \left(\mathrm{I}_{0} / \mathrm{I}\right)=\sigma_{10} \mathrm{Nd}\right) \rightarrow \mathrm{x} 2.303$ to reach base e

## The photolysis rate

The photolysis rate, $\mathrm{j}\left(\mathrm{s}^{-1}\right)$, is given by:

$$
\mathrm{j}=\int_{\lambda} \phi(\lambda) \sigma(\lambda) \mathrm{L}(\lambda) \mathrm{d} \lambda
$$

- quantum yield $\phi(\lambda)$ ( ),
- absorption cross section $\sigma\left(\mathrm{cm}^{2}\right)$,
- actinic flux, $\mathrm{L}(\lambda)\left(\mathrm{cm}^{-2} \mathrm{~s}^{-1}\right)$

L is the total intensity of effective light (direct + scattered + reflected, spherically integrated).

## The photolysis rate

| *ype of surface | Albedo |
| :--- | :---: |
| Snow | 0.69 |
|  | $0.93^{b}$ |
|  | $0.9-1.0$ |
| Ocean | $0.07^{b}$ |
|  | $0.06-0.08^{a}$ |
| Forests | $0.06-0.18^{b}$ |
|  | $0.02^{a}$ |
|  | 0.17 |
| Fields and meadows | $0.03-0.04^{a}$ |
| Desert | $0.06-0.09^{a}$ |
| Salt flats | $0.57-0.65^{a}$ |

$L(\lambda)$ is a function of the solar zenith angle, cloudiness, aerosol concentration, and surface albedo*. Foress

Fields and meadows
${ }^{a}$ Minimum reflectivities at 370 nm .
${ }^{b}$ Measured with respect to $\mathrm{NO}_{2}$ ph

$$
\frac{d n_{A}}{d t}=-n_{A} \underbrace{\int_{\lambda} \phi(\lambda) \sigma(\lambda)\left(\int_{0}^{2 \pi} \int_{0}^{\pi} L(\lambda, \theta, \varphi) \sin \theta d \theta d \varphi\right) d \lambda}_{\mathrm{j}_{\mathrm{A}}}
$$

Typical j-values for midlatitude noontime equinox conditions range from $\sim 1 \cdot 10^{-5} \mathrm{~s}-1$ for $\mathrm{j}_{\text {O(1D) }}$ to $\sim 0.2 \mathrm{~s}^{-1}$ for $\mathrm{j}_{\mathrm{NO}}$. The actinic flux under these conditions is about $2 \cdot 10^{14}$ photons $\mathrm{cm}^{-2} \mathrm{~s}^{-1}$ at $315-320 \mathrm{~nm}$, and $7 \cdot 10^{14}$ photons $\mathrm{cm}^{-2} \mathrm{~s}^{-1}$ at $360-365 \mathrm{~nm}$.

## The photolysis rate

L is measured using a $(2 \pi)$ radiometer or by measuring the photolytic decay (so-called chemical actinometry).
Its value can be estimated via tabulated values of $\phi$ and $\sigma$ for intervals of $\lambda$ and estimates of $L(\lambda)$ for given conditions.

Fig. 3 Theoretical diurnal variation of the $J\left[\mathrm{NO}_{2}\right]$ and $J\left[\mathrm{O}_{3}\right]$ values for midsummer and midwinter at $40^{\circ} \mathrm{N}$ latitude near sea level.
(Calvert, 1985)

## Example $j_{o 3}$ : Quantum yield $\phi_{i}(\lambda)$ for $\mathrm{i}=\mathrm{O}_{3}+\mathrm{h} \nu \rightarrow \mathrm{O}\left({ }^{1} \mathrm{D}\right)+\mathrm{O}_{2}\left({ }^{3} \Sigma_{\mathrm{g}}{ }^{-}\right)$

TABLE 4.6 Parameterization of Quantum Yields for $\mathrm{O}\left({ }^{1} \mathrm{D}\right)$ Production from $\mathrm{O}_{3}$ Photolysis in the 306- to $329-\mathrm{nm}$ Region at Various Temperatures ${ }^{a}$

| Wavelength <br> (nm) | $\boldsymbol{A}$ | $\boldsymbol{B}$ |
| :---: | :---: | :---: |
| 306 | 0.80 | 9.84 |
| 307 | 0.78 | 1.44 |
| 308 | 0.87 | 53.1 |
| 309 | 0.76 | 73.9 |
| 310 | 1.31 | 305.5 |
| 311 | 2.37 | 600 |
| 312 | 5.8 | 925.9 |
